### **DETAILED ACTION**

#### Response to Amendment

This Action is in response to applicant's amendment/arguments filed on October 26, 2007. **Claims 1-31** are now currently pending in the present application.

## Response to Arguments

Applicant's arguments with respect to claims 1-31 have been considered but are moot in view of the new ground(s) of rejection.

## Claim Rejections - 35 USC § 112

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claim 31 is rejected under 35 USC 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

For claim 31, the applicant appears to be writing independent claims. However, no fee has been paid for these claims. Therefore, the examiner assumes that they were meant to be independent claims, and therefore, must be written in the proper format.

# Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

- 1. Determining the scope and contents of the prior art.
- 2. Ascertaining the differences between the prior art and the claims at issue.
- 3. Resolving the level of ordinary skill in the pertinent art.
- 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claims 1, 3-8, 10-13, 15, 17-20, 22-25, 27, 29, and 30 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gopalakrishnan et al. (US PGPUB 2002/0183064 A1, hereinafter Gopalakrishnan) in view of Narasimhan (US Patent 7,505,788 B1) in view of and further in view of Ling et al. (US Patent 5,737,327, hereinafter Ling).

Consider **claims 1, 13 and 25 and 31**. Gopalakrishnan discloses a method for transmitting data in a code division multiple access (CDMA) communication network (abstract), comprising:

allocating a common Walsh code to a group of transceivers (page 1 and 2 paragraphs 0010-0012

where Gopalakrishnan discloses allocating Walsh codes for signaling, protocol information and voice and data services);

allocating a respective, different long code to each transceiver in the group (page 1 and 2 paragraphs 0010- 0012 where Gopalakrishnan discloses allocating user specific long codes); and time-multiplexing transmission of the data to the transceivers in the group by applying the common Walsh code and the respective long code of each transceiver to data packets directed to the transceivers so as to form multiplexed data packets, and transmitting the multiplexed data packets in sequence over the network to the group of transceivers (page 1 and 2 paragraphs 0010- 0012 where Gopalakrishnan discloses that the long code is combined with Walsh codes and transmitted to the mobile stations. The initial Walsh spreading is done to enable the BS to differentiate between the categories of data, and the subsequent long code spreading is done to differentiate between users).

Gopalakrishnan discloses the claimed invention but fails to explicitly teach that the group of transceivers being grouped together based upon a mutual data rate.

However, Narasimhan teaches that the group of transceivers being grouped together based upon a mutual data rate (column 1 lines 34-41, read as active antennas may have the same data rate).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have incorporated the teachings of Narasimhan into the invention of Gopalakrishnan in order to increase to capacity of the channels.

In addition, Gopalakrishnan and Narasimhan fail to explicitly teach the long code being specific to the transceiver in the group and enabling only the specific transceiver in the group to

decode the data that was intended for said specific transceiver (The examiner notes that this is the general concept of long codes. Nonetheless, the examiner has provided applicants with the Narasimhan reference to disclose this feature).

However, Ling teaches the long code being specific to the transceiver in the group and enabling only the specific transceiver in the group to decode the data that was intended for said specific transceiver (column 5 lines 11-23, read as the PN code is unique to the mobile station 100, so that no other receiver in communication with the base station may decode the traffic channel transmitted to the mobile station).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have incorporated the teachings of Ling into the invention of Gopalakrishnan and Narasimhan in order to avoid eavesdropping or spoofing thus making the system more secure.

Consider **claims 7 and 19**. Gopalakrishnan discloses a method for transmitting data in a code division multiple access (CDMA) communications network (abstract), comprising:

allocating a plurality of different Walsh codes to respective sets of transceivers (page 1, 2 and 4 paragraphs 0010- 0012 and 0040 where Gopalakrishnan discloses that different Walsh codes are allocated to mobile stations to distinguish the categories of data that is transmitted on the channel);

allocating a respective, different long code to each of the transceivers in the sets (page 1 and 2paragraphs 0010- 0012 where Gopalakrishnan discloses allocating user specific long codes; and

Art Unit: 2617

for each Walsh code, time-multiplexing transmission of the data to the transceivers in the respective set by applying the Walsh code and the respective long code of each transceiver of the respective set to data packets directed to the transceivers so as to form multiplexed data packets, and transmitting the multiplexed data packets in sequence over the network to the sets of transceivers (page 1 and 2 paragraphs 0010- 0012 where Gopalakrishnan discloses that the long code is combined with Walsh codes and transmitted to the mobile stations. The initial Walsh spreading is done to enable the BS to differentiate between the categories of data, and the subsequent long code spreading is done to differentiate between users).

Gopalakrishnan discloses the claimed invention but fails to explicitly teach that the group of transceivers being grouped together based upon a mutual data rate.

However, Narasimhan teaches that the group of transceivers being grouped together based upon a mutual data rate (column 1 lines 34-41, read as active antennas may have the same data rate).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have incorporated the teachings of Narasimhan into the invention of Gopalakrishnan in order to increase to capacity of the channels.

In addition, Gopalakrishnan and Narasimhan fail to explicitly teach the long code being specific to the transceiver in the group and enabling only the specific transceiver in the group to decode the data that was intended for said specific transceiver (The examiner notes that this is the general concept of long codes. Nonetheless, the examiner has provided applicants with the Narasimhan reference to disclose this feature).

However, Ling teaches the long code being specific to the transceiver in the group and enabling only the specific transceiver in the group to decode the data that was intended for said specific transceiver (column 5 lines 11-23, read as the PN code is unique to the mobile station 100, so that no other receiver in communication with the base station may decode the traffic channel transmitted to the mobile station).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have incorporated the teachings of Ling into the invention of Gopalakrishnan and Narasimhan in order to avoid eavesdropping or spoofing thus making the system more secure.

Consider claims 3, 15 and 27 and as applied to claim 1, 13 and 25 respectively.

Gopalakrishnan disclose wherein the transceivers are wireless and comprise mobile transceivers in a cellular network (abstract, page 1 paragraph 0006).

Consider claims 5, 17 and 29 and as applied to claim 1, 13 and 25. Gopalakrishnan discloses wherein the transceivers are configured to receive the multiplexed data packets at a common data transfer rate (see page 1 paragraph 0005, page 3 paragraph 0024)

Consider **claims 6, 18 and 30 and as applied to claim 1, 13 and 25**. Gopalakrishnan discloses wherein the transceivers are adapted to communicate using one or more voice channels and one or more data channels, and wherein the common Walsh code defines one of the data channels page 1, 2 and 4 paragraphs 0006, 0010- 0012 and 0040)

Consider **claims 8 and 20 and as applied to claim 7 and 19**. Gopalakrishnan discloses wherein allocating the plurality of different Walsh codes comprises measuring a voice-channel power used by a central transmitter for transmitting voice channels to the transceivers, and

allocating and de-allocating at least one of the different Walsh codes in response to at least one of an excess power available to the central transmitter above the voice-channel power, an additional Walsh code available to the transmitter, and cell site modem resources available to the transmitter (see page 2 paragraph 0019 where Gopalakrishnan discloses the power budget for the uplink channel which is used for voice users).

Consider **claims 10 and 22 and as applied to claim 7 and 19 above**. Gopalakrishnan discloses assigning each set of transceivers to two or more groups of transceivers, and assigning each group to receive the data at a different respective data transfer rate (see page 4 paragraphs 0039-0041).

Consider claims 11 and 23 and as applied to claim 10 and 22 above. Gopalakrishnan discloses setting, for each group, the different transfer rate in response to a radio receiving condition of the group at a central transceiver for the transceivers (see page 3 paragraphs 0026-31, page 4 paragraphs 0039-0041).

Consider claims 12 and 24 and as applied to claim 10 and 22 above. Gopalakrishnan discloses re-allocating a specific transceiver comprised in a first group comprised in the two or more groups to a second group comprised in the two or more groups in response to radio conditions at the specific transceiver (see page 3 paragraphs 0034-0036).

Claims 2, 9, 14, 21, and 26 are rejected under 35 U.S.C. 103(a) as being unpatentable over is Gopalakrishnan (US PGPUB 2002/0183064 A1, hereinafter Gopalakrishnan A) in view of Narasimhan (US Patent 7,505,788 B1) in view of Ling et al. (US Patent 5,737,327, hereinafter Ling) and further in view of Gopalakrishnan (US Patent 7,009,949 B1, hereinafter Gopalakrishnan B).

Art Unit: 2617

Consider claims 2, 14 and 26 and as applied to claim 1, 13 and 25 respectively.

Gopalakrishnan A, Narasimhan, and Ling disclose that the transceivers in the group have respective data throughput rates, and wherein transmitting the multiplexed data packets comprises identifying a specific transceiver in the group among the data throughput rates of the transceivers in the group, and applying the respective long code to transmit at least one multiplexed data packet to the specific transceiver (see abstract page paragraph O026-O031).

However, Gopalakrishnan A, Narasimhan, and Ling fail to explicitly disclose identifying a specific transceiver in the group having a minimum data throughput rate.

In the related art Gopalakrishnan B discloses identifying a specific transceiver in the group having a minimum data throughput rate (abstract, column 2 lines 3-10, column 3 lines 22-46)

Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Gopalakrishnan A, Narasimhan, and Ling with the teachings of Gopalakrishnan B to provide dynamic resource allocation

Consider claims 9 and 21 and as applied to claim 7 and 19. Gopalakrishnan A, Narasimhan, and Ling fail to specifically disclose assigning and de-assigning at least one of the different Walsh codes to a specific receiver comprised in the transceivers in response to a data call directed to the specific receiver.

In the related art Gopalakrishnan B discloses assigning and de-assigning at least one of the different Walsh codes to a specific receiver comprised in the transceivers in response to a data call directed to the specific receiver (see column 1 lines 39-65).

Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Gopalakrishnan A, Narasimhan, and Ling with the teachings of Gopalakrishnan B because of the nature of latency requirements of transmitting voice compared to transmitting data (transmitting voice requires dedicated whereas transmitting data does not).

Claims 4, 16, and 28 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gopalakrishnan et al. (US PGPUB 2002/0183064 A1, hereinafter Gopalakrishnan) in view of Narasimhan (US Patent 7,505,788 B1) in view of Ling et al. (US Patent 5,737,327, hereinafter Ling) and further in view of Devon (US Patent 5,692,127).

Consider claims 16 28 and as applied to claims 13 and 25, respectively.

Gopalakrishnan, Narasimhan, and Ling disclose the claimed invention but fail to explicitly teach wherein the transceivers are wired and comprise landline transceivers in a communication network.

However, Devon teaches wherein the transceivers are wired and comprise landline transceivers in a communication network (column 3 lines 62-65).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have incorporated the teachings of Devon into the invention of Gopalakrishnan, Narasimhan, and Ling in order to further improve secure communication.

#### Conclusion

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any response to this Office Action should be faxed to (571) 273-8300 or mailed to:

Commissioner for Patents

P.O. Box 1450

Alexandria, VA 22313-1450

Hand-delivered responses should be brought to

Customer Service Window Randolph Building 401 Dulany Street

Alexandria, VA 22314

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Christopher M. Brandt whose telephone number is (571) 270-1098. The examiner can normally be reached on 7:30a.m. to 5p.m..

Application/Control Number: 10/768,845 Page 12
